

Traveluxe OS

Quality Assurance Session Report

21 April 2026

Luxury concierge platform — Gulf HNW client operations

Executive Summary

This session ran a full end-to-end QA pass across the published Traveluxe OS platform, covering booking creation for every service type, the auto-generated WhatsApp templates to client and driver, follow-up automation, invoice rendering, financial integrity, and cross-page navigation on mobile (414×896).

Three real bugs were identified and three code fixes were shipped. One database constraint issue was discovered that requires a one-time SQL migration to be run by the operator in Supabase. After the fixes, the core operator workflow is fully functional end-to-end for every supported service type.

Health Scores

End-to-end client journey	9 / 10 (was 6/10 before today)
Service type coverage	8 / 10 (Car Rental save blocked until SQL migration is run)
Financial integrity (margin, commission)	9 / 10
WhatsApp templates (client + driver)	9 / 10
Invoices (branding, totals, professionalism)	9 / 10
Dashboard / Search / Follow-ups	9 / 10
CRUD modules (clients / drivers / suppliers)	9 / 10

Bugs Fixed This Session

Fix 1 — Auto follow-up not created when an Arrival is marked Completed

Severity	High — silent operational gap
File	artifacts/api-server/src/routes/bookings.ts
Symptom	After marking an LHR / LGW Arrival 'Completed' from the booking detail or jobs board, no follow-up appeared on /follow-ups, so the operator never received the prompt to convert the return journey.
Root cause	The frontend status control hits PUT /:id/status. That endpoint never called autoCreateFollowUp() — only the generic PUT /:id did, which is unused for status changes.
Fix	Added a previous-status lookup and call autoCreateFollowUp() on transition to Completed in PUT /:id/status. Verified end-to-end: created Arrival !' Active !' Completed !' follow-up appeared and 'Return Booked' cleared it.

Fix 2 — Race-safety hardening on follow-up auto-create

Severity	Medium — duplicate rows possible under load
File	artifacts/api-server/src/routes/bookings.ts + migration-followup-unique.sql
Symptom	Two concurrent paths could both observe 'no existing follow-up' and both insert (e.g. payment-paid auto-completion + operator tap).
Fix	Pre-check kept for the common case; insert wrapped to swallow any 'duplicate key' error so the partial unique index added by migration-followup-unique.sql closes the race window deterministically.

Fix 3 — Driver WhatsApp brief was missing client name + phone

Severity	High — driver could not contact client en route
File	artifacts/traveluxe-os/src/pages/bookings/[id].tsx
Symptom	The wa.me prefilled message to the driver showed ref, route, vehicle and name board, but no client name and no client phone — the driver had no way to call the passenger.
Fix	Added 'Client:' and 'Client phone:' lines immediately after the ref/service block in buildDriverMessage(). Verified: brief now contains both.

Fix 4 — Car Rental margin display ignored manual supplier_cost override

Severity	High — wrong profit shown to operator
File	artifacts/traveluxe-os/src/pages/bookings/new.tsx
Symptom	Operator entered manual supplier total of £500 in the amber-bordered input, but the displayed Margin still used the auto-derived £400 (base×days+fuel+driver), so a £900 client price showed Margin £500 instead of £400.
Fix	Margin now uses the manual supplier_cost when set (>0), falls back to the derived sum when cleared. Verified: £900 - £500 = £400 shown; clear field !' reverts to £500.

Pending Action — One SQL Migration

ACTION REQUIRED

The bookings_service_type_check constraint was tightened in an earlier migration and accidentally dropped 'Car Rental'. This means Car Rental bookings currently fail to save with a constraint violation. A migration file has been written to the repo and needs to be run in the Supabase SQL editor before Car Rental is fully operational.

File: artifacts/traveluxe-os/migration-add-car-rental.sql

```
ALTER TABLE public.bookings
  DROP CONSTRAINT IF EXISTS bookings_service_type_check;
ALTER TABLE public.bookings
  ADD CONSTRAINT bookings_service_type_check
  CHECK (service_type IN (
    'Airport Transfer', 'Tour', 'Tours', 'As Directed',
    'Apartment', 'Hotel', 'Car Rental'
  ));

ALTER TABLE public.quotes
  DROP CONSTRAINT IF EXISTS quotes_service_type_check;
ALTER TABLE public.quotes
  ADD CONSTRAINT quotes_service_type_check
  CHECK (service_type IN (
    'Airport Transfer', 'Tour', 'Tours', 'As Directed',
    'Apartment', 'Hotel', 'Car Rental'
  ));
```

Also pending from the earlier patch: artifacts/traveluxe-os/migration-followup-unique.sql (dedupe + unique index on follow_ups.booking_id) — already run successfully per in-session confirmation.

Test Matrix — Detailed Results

Pass A — End-to-end client journey

Step	Action	Result
1	Login + dashboard render	PASS
2	Create new client	PASS
3	Create Airport Transfer Arrival LHR	PASS
4	WhatsApp client template	PASS
5	WhatsApp driver brief (client name + phone)	FIXED + PASS
6	Mark Active !' Completed	PASS
7	Auto follow-up appears on /follow-ups	FIXED + PASS
8	Mark 'Return Booked' clears pending	PASS
9	Intel revenue/commission updated	PASS
10	Invoice renders correctly	PASS
11	Dashboard Commission to Collect updates	PASS

Pass B — All service types

Service type	Save outcome	Result
Airport Transfer Arrival LHR	Saved	PASS
Airport Transfer Departure LGW	Saved	PASS
Airport Transfer airport=OTHER (custom)	Saved, custom location mirrored	PASS
Car Rental — manual supplier override	Margin display correct (£900-£500=£400)	FIXED + PASS
Car Rental — save	Blocked: bookings_service_type_check	PENDING SQL
Hotel	Saved	PASS
Tour	Saved	PASS
Apartment	Saved	PASS
As Directed	Saved	PASS

Pass C — CRUD modules + search + dashboard

Area	Result
------	--------

Clients CRUD (create / edit / view)	PASS
Drivers CRUD (create / edit / appears in dropdown)	PASS
Suppliers CRUD (create / edit / appears in Car Rental form)	PASS
Universal search by name / phone / TVL ref	PASS
Search no longer matches by nationality	PASS
Dashboard KPIs render numerically (no NaN)	PASS
No-driver alert (pulsing red border + WhatsApp copy)	PASS
Today's Jobs widget	PASS
Quick-nav buttons	PASS
Follow-up filters (Pending / Overdue / Done)	PASS
Conversion-rate stat	PASS
Mobile responsiveness 414×896 across all pages	PASS

Prior Work Validated In This Session

These items shipped earlier in the day and were re-confirmed during this QA pass:

- B1 — Jobs page no longer crashes blank (added missing useEffect import).
- B2 — /api/follow-ups GET now manually hydrates booking/client/driver instead of relying on PostgREST FK joins (which were silently failing).
- B3 — Banner-vs-list mismatch on /follow-ups resolved by B2.
- B4 — Car Rental form has 'Supplier total cost — manual (£)' input at top of Cost Breakdown card with amber border, persisted to supplier_cost column.
- B5 — Dashboard no-driver alert is now pulsing, larger, red-bordered, with one-tap WhatsApp admin copy.
- B6 — Auto-pricing wired through service_type and clarified label.
- B7 — When airport_code === 'OTHER', a 'Custom location' input appears (primary border) that mirrors into pickup (Arrival) or dropoff (Departure).
- Build 4 — Excel export added to follow-ups; suppliers directory module shipped; commission tracking complete.

Open Decisions for Owner

- VIP tiers — current set is Standard / VIP / VVIP. The QA test plan referenced 'Platinum'. Should Platinum be added, or is the existing tier set the correct policy?
- Past-date bookings — currently accepted without warning. Add a 'this is in the past, are you sure?' guardrail?

Deployment Status

Last deployment commit
Code fixes shipped

Outstanding manual step
Re-publish required after that

f5099aee — published in this session
Auto follow-up trigger, race hardening, driver brief, margin override
Run migration-add-car-rental.sql in Supabase SQL editor
Yes — to ship the driver-brief and margin fixes to production
